Amendments to the Claims

1. (currently amended) A container comprising:

a first container portion having a wall defining an interior and an exterior of the first container portion; and

a second container portion having a wall defining an interior and an exterior of the second container portion, the wall of the second container portion defining a side wall of the second container portion that terminates at a top of the second container portion such that an opening at the top of the second container portion has a width that is at least as wide as a largest interior width of the second container portion, the exterior of the second container portion being spaced apart from the exterior of the first container portion via a connecting portion, the exterior of the second container portion being fixedly connected to the exterior of the first container portion solely along a length of a single side of the exterior of the second container portion that faces the exterior of the first container portion by the connection portion, the first container portion, second container portion and connecting portion being co-molded as an integral single piece,

wherein the container does not include a passageway that (1) extends between the interior of the first container portion and the interior of the second container portion and (2) facilitates communication of a fluid between the interior of the first container portion and the interior of the second container portion.

2. (original) The container of claim 1, wherein the first container portion has an inwardly directed depression formed in a lower portion of the wall of the first container portion.

3. (original) The container of claim 1, wherein the second container portion has an inwardly directed depression formed in a lower portion of the wall of the second container portion.

4. (original) The container of claim 1, wherein the connecting portion is formed at a height above the bottom of the first container portion.

5. (original) The container of claim 1, wherein the second container portion has at least one reinforcement formed in the wall of the second container portion.

6. (original) The container of claim 5, wherein the reinforcement comprises at least one rib formed in the wall of the second portion.

7. (original) The container of claim 5, wherein the reinforcement comprises at last one crease formed in the wall of the second container portion.

8. (original) The container of claim 5, wherein the reinforcement comprises a lip formed at or around a top of the wall of the second container portion.

9. (original) The container of claim 1, wherein the first container portion comprises a plurality of chambers.

10. (original) The container of claim 1, wherein the first container portion comprises a handle.

11. (original) The container of claim 1, wherein the connecting portion comprises at least one reinforcement formed therein.

12. (canceled).

13. (original) The container of claim 1, wherein the container is used with a material delivery device.

14. (original) The container of claim 1, wherein the material delivery device is at least one of a spout extension, a spray nozzle and a funnel.

15. (withdrawn) A method of forming a container, the method comprising the steps of:
co-molding, as an integral single piece, a wall defining an interior and an exterior of a first container portion, a wall defining an interior and an exterior of a second container portion, the wall of the second container portion defining a side wall of the second container portion that terminates at a top of the second container portion such that an opening at the top of the second container portion has a width that is as wide as a largest interior width of the second container portion, the exterior of the second container portion being fixedly connected to the exterior of the first container portion solely along a length of a single side of the exterior of the second container portion that faces the exterior of the first container portion by a connecting portion, and the connecting portion integral to and spacing apart the exteriors of the first container portion and the second container portion, the first and second container portions having no passageway therebetween.

16. (withdrawn) The method of claim 15, wherein the connecting portion is formed with at least one reinforcement therein.

17. (canceled).
